

Detecting Oral Cancer

A guide for health care professionals

U.S. DEPARTMENT OF HEALTH AND HUMAN SERVICES
NATIONAL INSTITUTES OF HEALTH
National Institute of Dental and Craniofacial Research

Presented by:
Lynne M. Moseley, D.D.S.
Director: Oral Oncology
Kermanos Cancer Institute

1

Introduction

- In 2008, the ACS estimated that over 1.4 million new cancer cases would be diagnosed in the United States.
- Further estimated that over 500,000 were expected to die which equals to more than 1500 /day.
- Overall, cancer is the leading cause of death in women age 40-79 and among men from age 60-79.

4

- The incidence of cancer and the mortality rates vary significantly among racial and ethnic groups

For all cancer sites combined:

African American men have a 25% higher cancer incidence and 43% mortality rate compared to white men

African American women have lower incidence rates than do white women, but have 20% higher mortality rate.

7

- Cancer is characterized by the uncontrolled growth and spread of abnormal cells
- Extrinsic and Intrinsic factors
- Extrinsic: tobacco, alcohol, chemicals, solar and ionizing radiation, infectious microorganisms, environmental pollutants and medications
- Intrinsic: inherited mutations, hormones and immune conditions

Cancer Treatment

- Surgery, chemotherapy, radiation therapy, hormones and immunotherapy
- Surgery is most common for primary tumors and may be curative
- When tumor metastasizes, RT and chemotherapy are necessary for definitive care

Incidence and Survival of Oral or Pharyngeal Cancer

- 30,000 new cases diagnosed yearly
- 8,000 deaths each year
- 5 year survival rate: 50%

Early Detection Saves Lives

- 5-year survival for localized disease is 76%
- 5-year survival for metastatic disease is 19%

11

Early Detection is Often Possible

- Tissue changes in the mouth that may signal cancer can often be seen and felt easily

12

Warning Signs

- Leukoplakia
- Erythroplakia

13

Other Possible Warning Signs

- Lump or thickening of oral soft tissue
- Soreness or "lump" in throat
- Difficulty chewing or swallowing
- Ear pain
- Difficulty moving jaw or tongue
- Hoarseness
- Numbness of tongue or mouth
- Swelling of the jaw

14

Review of Risk Factors

- Tobacco use
- Alcohol use
- Exposure to sunlight
- Age
- Gender
- Race

15

Examination Overview

- Head and neck exam should be a routine part of dental and medical check-ups.
- Take a history of alcohol and tobacco use.
- Follow up on suspicious signs.

18

Tools and Time

- Proper lighting
- Dental mouth mirror
- Gauze squares
- Gloves
- 5 minutes

19

Extraoral Examination

20

Perioral and Intraoral Soft Tissue Examination: Lips

21

Perioral and Intraoral Soft Tissue Examination: Labial Mucosa

22

**Perioral and Intraoral Soft
Tissue Examination: Labial Mucosa**

23

**Perioral and Intraoral Soft
Tissue Examination: Buccal Mucosa**

24

**Perioral and Intraoral Soft
Tissue Examination: Buccal Mucosa**

25

**Perioral and Intraoral Soft
Tissue Examination: Gingiva**

26

**Perioral and Intraoral Soft
Tissue Examination: Dorsum of
the Tongue**

27

**Perioral and Intraoral Soft
Tissue Examination: Left Margin of
the Tongue**

28

**Perioral and Intraoral Soft
Tissue Examination: Right Margin of
the Tongue**

29

**Perioral and Intraoral Soft
Tissue Examination: Ventral Surface
of the Tongue**

30

**Perioral and Intraoral Soft
Tissue Examination: Floor of
the Mouth**

31

**Perioral and Intraoral Soft
Tissue Examination: Hard Palate**

32

**Perioral and Intraoral Soft
Tissue Examination: Oropharynx**

33

**Perioral and Intraoral Soft
Tissue Examination**

34

Oral Lesions Suspicious for Oral Cancer

- Homogenous leukoplakia
- Leukoplakia with early squamous cell carcinoma
- Nodular leukoplakia with severe epithelial dysplasia
- Erythroleukoplakia with candida infection

36

Homogenous Leukoplakia

37

Leukoplakia with early squamous cell carcinoma

38

Nodular leukoplakia with severe epithelial dysplasia

39

Erythroleukoplakia with candida infection

BrushTest
Because every unexplained spot
deserves to be tested.

Just brush over suspicious spots with the BrushTest.
Visually, every oral cancer lesion, even as tiny as a freckle, appearing white, pink or red, can't tell you the real story until you test it.

Only laboratory testing can determine that a small spot is not dangerous. That's why only the BrushTest can give you the answer. Only the BrushTest.

Now, you have another tool that puts you at a 100% advantage. BrushTest is the only tool that can tell you if a spot is dangerous.

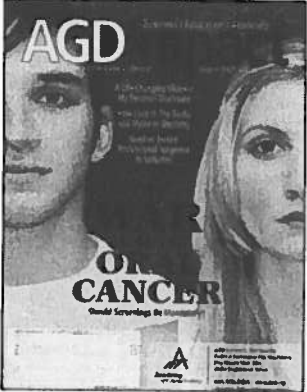

OralCDx
Oral cancer screening device

OralCDx - Because only testing can tell.™

AGD American Geriatric Dentistry

Oral Cancer

Should Screenings Be Routine?

AGD is committed to the health and well-being of its members. We are dedicated to providing the highest quality of care and to ensuring that our members are always up-to-date on the latest in dental technology and research.
